Betreff **Animal transport - Calculation of minimum space for cattle**

19.06.2009 18:55

Andere Aktionen

Dear Dr. Simonin,

during road checks of animal transports with the authorities we keep on noticing that there are problems to calculate the minimum space requirements for cattle.

Indeed the table of Reg. 1/2005 (first annex)

- is not clear because it gives the impression that the range shown in the last column indicates the minimum and maximum space for the weight category shown in the second column (ex. for calves of 50 kg it is indicated 0,3 – 0,4 m<sup>2</sup>). In our opinion this is not the case and the table must be read like this: calves of 50 kg must have a minimum space of 0,3m<sup>2</sup>, calves of 110 kg must have a minimum space of 0,4m<sup>2</sup> etc.
- makes it very difficult to determine the minimum space requirements for cattle with a weight in-between the weights indicated in the table. For example, how should the minimum space of a bovine of 400 kg be calculated?

In order to give a practical aid to the authorities, i.e. in order to provide them with the possibility to easily determine the minimum space requirements, we made the attached chart and calculated 5 equations for the 5 weight ranges of cattle (second attachment).

We would very much appreciate, if you could let us know, if our interpretation of the density table in Reg. 1/2005 is correct.

With best wishes,

Christine
